# WEEK-07-MCQ-Lists

1.What will be the output	after the following sta	tements?	
m = [5, 10, 35]			
del m[:]			
print(m)			
a. [5, 10, 35]	b. 5, 10, 35	c. []	d. [5, 35]
2. L=[1,5,9]			
print(sum(L),max(L),mi	n(L))		
what will be the expected	d output for this follow	ing?	
Answer:15 9 1			
	. 6 6.11		
3. What will be the outpu	_	atements?	
	mber', 'December']		
n = m[0] + m[2]			
print( n )			
a.SeptemberDecember	b.JulyDecemb	<mark>oer</mark> c.JulySepte	mber d.July
4. L=['Amit",Anita",Zee",Lon	gest Word']		
print(max(L))			
what will be the expected	d output for this follow	ing?	
Answer: Longest Word			
5. Fill in the blanks with s	ame word in both plac	es	
>>> import	arrie word in Sour plac		
>>> list1 = [1,2,3,4,5]			
>>> list2 =copy	(list1)		
>>> list2 =copy	(11361)		
a.Pickle	b.Math	c C	2014
a.rickie	D.IVIAUI	c.Co	<del>γγ</del>

6. Write the output of the following: def listchange(L): L.append(45) return L1 = [1, 2, 3, 4]listchange(L1) print(L1) what will be the expected output for this following? Answer: [1,2,3,4,45] 7. What will be the output after the following statements? m = 'A' n = 'B' o = 'C' p = [m, n, o]print(p) a. 'C', 'A', 'B' b. ['C', 'B', 'A'] c. ['A', 'B', 'C'] d. ['C', 'A', 'B'] 8. What will be the output after the following statements? m = [4, 8]print(m \* 3) a. [4, 8, 4, 8, 4, 8] b. [4, 8, 4, 8] c. [4, 8] d. [4, 8] \* 3 9. What will be the output after the following statements? m = [75, 23, 64]n = m[0] + m[1]print(n) a.75 b.23 c.98 d.64 10. What is the data type of m after the following statement? m = ['July', 'September', 'December'] a.String b.Tuple c.Dictionary d.List

# WEEK-07-CODING-Lists

1. Program to print all the distinct elements in an array. Distinct elements are nothing but the unique (non-duplicate) elements present in the given array.

## Input Format:

First line take an Integer input from stdin which is array length n.

Second line take n Integers which is inputs of array.

## **Output Format:**

Print the Distinct Elements in Array in single line which is space Separated

## Example Input:

5

1

2

2

3

4

#### Output:

1234

# Example Input:

6

1

1

2

2

3

3

## Output:

123

# For example:

Input	R	es	ul	t
5 1 2 2	1	2	3	4

Input	Result
4	
6 1 1 2 2 3 3	1 2 3

# Coding:

```
def ele():
    n=int(input().strip())
    a=[]
    for _ in range(n):
        while True:
        e=int(input().strip())
        a.append(e)
        break

d=set(a)
    d=sorted(d)
    print(' '.join(map(str,d)))
ele()
```

	Input	Expected	Got	
~	5	1 2 3 4	1 2 3 4	~
	2			
	2			
	4			
~	6	1 2 3	1 2 3	~
	1			
	2			
	3			
	3			

2. Given an integer n, return an list of length n + 1 such that for each i (0 <= i <= n), ans[i] is the number of 1's in the binary representation of i.

## Example:

**Input:** n = 2 Output: [0,1,1] Explanation: 0 --> 0 1 --> 1 2 --> 10 Example2: **Input:** n = 5 Output: [0,1,1,2,1,2] Explanation: 0 --> 0 1 --> 1 2 --> 10 3 --> 11 4 --> 100 5 --> 101

Note: Complete the given function alone

# For example:

Test	Result
print(CountingBits(5))	[0, 1, 1, 2, 1, 2]

# Coding:

def CountingBits(n):
 res=[]
 for i in range(n+1):
 res.append(bin(i).count('1'))
 return res

	Test	Expected	Got	
~	print(CountingBits(2))	[0, 1, 1]	[0, 1, 1]	~
~	print(CountingBits(5))	[0, 1, 1, 2, 1, 2]	[0, 1, 1, 2, 1, 2]	~
Passe	d all tests! 🗸			

3. Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that A[i] - A[j] = k, i != j.

# Input Format

- 1. First line is number of test cases T. Following T lines contain:
- 2. N, followed by N integers of the array
- 3. The non-negative integer k

# Output format

Print 1 if such a pair exists and 0 if it doesn't.

## Example

# Input

1

3

1

3

5

4

# Output:

1

# Input

1

3

1

3

5

99

Output

0

# For example:

Input	Result
1 3 1	1
3 5 4	
1 3	0

Input	Result
1 3 5 99	

```
Coding:
def pair(arr,n,k):
  i, j = 0, 1
  while i < n and j < n:
     if i != j and arr[j]-arr[i]==k:
       return 1
     elif arr[j] - arr[i] < k:
       j +=1
     else:
       i +=1
     if i == j:
       j +=1
  return 0
def main():
  t = int(input().strip())
  for _ in range(t):
     n = int(input().strip())
     arr = []
     for _ in range(n):
       arr.append(int(input().strip()))
     k = int(input().strip())
     print(pair(arr,n,k))
if __name__ == "__main__":
```

# **Output:**

main()

	Input	Expected	Got	
~	1 3	1	1	<b>~</b>
	1			
	3 5			
	4			
~	1	0	0	~
	1			
	5			
	99

5. An array is monotonic if it is either monotone increasing or monotone decreasing. An array A is monotone increasing if for all i <= j, A[i] <= A[j]. An array A is monotone decreasing if for all i <= j, A[i] >= A[j].

Write a program if n array is monotonic or not. Print "True" if is monotonic or "False" if it is not. Array can be monotone increasing or decreasing.

Input Format:

First line n-get number of elements

Next n Lines is the array of elements

**Output Format:** 

True ,if array is monotone increasing or decreasing.

otherwise False is printed

Sample Input1

4

5

6

7

# For example:

Input	Result
4	True
6	
5	
4	
3	

# Coding: n=int(input())

```
arr =[int(input()) for _ in range(n)]
```

```
inc = True
dec = True
```

```
for i in range(1,n):
if arr[i] > arr[i-1]:
```

if inc or dec:

print("True") else:

print("False")

	Input	Expected	Got	
~	4 6 5 4 3	True	True	~
~	4 3 5 7 4	False	False	~
~	4 1 6 9 2	False	False	~
~	4 9 6 4 2	True	True	~
~	3 2 1 4	False	False	<b>~</b>

6. Given two arrays of positive integers, for each element in the second array, find the total number of elements in the first array which are *less than or equal to* that element. Store the values determined in an array.

For example, if the first array is [1, 2, 3] and the second array is [2, 4], then there are 2 elements in the first array less than or equal to 2. There are 3 elements in the first array which are less than or equal to 4. We can store these answers in an array, answer = [2, 3].

#### **Program Description**

The program must return an array of m positive integers, one for each maxes[i] representing the total number of elements nums[j] satisfying  $nums[j] \le maxes[i]$  where  $0 \le j < n$  and  $0 \le i < m$ , in the given order.

The program has the following:

nums[nums[0],...nums[n-1]]: first array of positive integers
maxes[maxes[0],...maxes[n-1]]: second array of positive integers

#### Constraints

- $2 \le n, m \le 10^5$
- 1 ≤ nums[j] ≤  $10^9$ , where  $0 \le j < n$ .
- 1 ≤ maxes[i] ≤  $10^9$ , where  $0 \le i < m$ .

# Input Format For Custom Testing

Input from stdin will be processed as follows and passed to the program.

The first line contains an integer *n*, the number of elements in *nums*. The next n lines each contain an integer describing nums[j] where  $0 \le j < n$ . The next line contains an integer m, the number of elements in maxes. The next *m* lines each contain an integer describing maxes[i] where  $0 \le i < m$ .

## Sample Case 0 Sample Input 0

# 4

4 2

1

4 2

3

# Sample Output 0

4

#### **Explanation 0**

We are given n = 4, nums = [1, 4, 2, 4], m = 2, and maxes = [3, 5].

- For maxes[0] = 3, we have 2 elements in nums(nums[0] = 1) and nums[2] = 2) that are  $\leq$ maxes[0].
- For maxes[1] = 5, we have 4 elements in nums(nums[0] = 1, nums[1] = 4, nums[2] = 2, and nums[3] = 4) that are  $\leq maxes[1]$ .

Thus, the program returns the array [2, 4] as the answer.

#### Sample Case 1

## Sample Input 1

2

10

5

4

8

4 3

1

7

8

#### Sample Output 1

0

## **Explanation 1**

We are given, n = 5, nums = [2, 10, 5, 4, 8], m = 4, and maxes = [3, 1, 7, 8].

- 1. For maxes[0] = 3, we have 1 element in nums(nums[0] = 2) that is  $\leq maxes[0]$ .
- 2. For maxes[1] = 1, there are 0 elements in nums that are  $\leq maxes[1]$ .
- 3. For maxes[2] = 7, we have 3 elements in nums (nums[0] = 2, nums[2] = 5, and nums[3] = 4) that are  $\leq maxes[2]$ .
- 4. For maxes[3] = 8, we have 4 elements in nums(nums[0] = 2, nums[2] = 5, nums[3] = 4, and nums[4] = 8) that are  $\leq maxes[3]$ .

Thus, the program returns the array [1, 0, 3, 4] as the answer.

# Coding:

```
import bisect
n= int(input())
nums =[int(input()) for _ in range(n)]
m= int(input())
maxes = [int(input()) for _ in range(m)]
nums.sort()

result = []
for maxval in maxes:
    count = bisect.bisect_right(nums, maxval)
    result.append(count)

for res in result:
    print(res)
```

		Input	Expected	Got

	Passe	d all tes	ts! 🗸		

7. The program must accept ${\bf N}$ integers and an integer ${\bf K}$ as the input. The program must print every K integers in descending order as the output.
Note: If N % K != 0, then sort the final N%K integers in descending order.
Boundary Condition(s):
1 <= N <= 10^4 -99999 <= Array Element Value <= 99999
Input Format:
The first line contains the values of N and K separated by a space. The second line contains N integers separated by space(s).
Output Format:
The first line contains N integers.
Example Input/Output 1:
Input:
7 3 48 541 23 68 13 41 6
Output:
541 48 23 68 41 13 6
Explanation:
The first three integers are 48 541 23, after sorting in descending order the integers are 541

48 23.
The second three integers are 68 13 41, after sorting in descending order the integers are 68 41 13.

The last integer is **6**.

The integers are **541 48 23 68 41 13 6** Hence the output is **541 48 23 68 41 13 6**.

# Coding:

```
N, K = map(int, input().split())
a = list(map(int, input().split()))
if len(a)< N:
    a.extend([O] * (N - len(array)))
result = []
for i in range(0,N,K):
    chunk = a[i:i + K]
    result.extend(sorted(chunk, reverse=True))
print(" ".join(map(str, result)))</pre>
```

# **Output:**

	Input	Expected	Got	
~	7 3 48 541 23 68 13 41 6	541 48 23 68 41 13 6	541 48 23 68 41 13 6	<b>~</b>
asse	d all tests! 🗸			

8. Assume you have an array of length n initialized with all 0's and are given k update operations.

Each operation is represented as a triplet: [startIndex, endIndex, inc] which increments each element of subarray A[startIndex ... endIndex] (startIndex and endIndex inclusive) with inc.

Return the modified array after all k operations were executed.

## **Example:**

#### Input:

5

3

132

243

0 2 -2

```
Output:
```

```
-20353
```

# **Explanation:**

```
Initial state:

length = 5, updates = [[1,3,2],[2,4,3],[0,2,-2]]

[0,0,0,0,0]

After applying operation [1,3,2]:

[0,2,2,2,0]

After applying operation [2,4,3]:

[0,2,5,5,3]

After applying operation [0,2,-2]:

[-2,0,3,5,3]
```

# Coding:

```
n= int(input())
k= int(input())

a = [0]* n
for _ in range(k):
    SI, EI, inc= map(int, input().split())
    for i in range(SI, EI +1):
        a[i] += inc

print(" ".join(map(str,a)))
```

		Input	Expected	Got	
	~	5 3 1 3 2 2 4 3 0 2 -2	-2 0 3 5 3	-2 0 3 5 3	<b>&gt;</b>
Р	asse	d all test	s! 🗸		

9. Given a matrix mat where every row is sorted in **strictly increasing** order, return the **smallest common element** in all rows.

If there is no common element, return -1.

## Example 1:

# Input:

45

12345

2 4 5 8 10

357911

13579

## **Output:**

5

#### **Constraints:**

- 1 <= mat.length, mat[i].length <= 500
- 1 <= mat[i][j] <= 10^4
- mat[i] is sorted in strictly increasing order.

# Coding:

```
import sys
from collections import Counter
f = input().strip()
n= int(f.strip()[0])

m=[]

for _ in range(n):
    r= list(map(int, input().split()))
    m.append(r)

counter=Counter()

for r in m:
    u = set(r)
    for e in u:
        counter[e] +=1

small = float('inf')
```

```
for e, count in counter.items():
    if count == n and e < small:
        small = e
    if small == float('inf'):
        print(-1)
else:
        print(small)</pre>
```

# **Output:**

	Input	Expected	Got	
~	4 5	5	5	~
	1 2 3 4 5			
	2 4 5 8 10			
	3 5 7 9 11			
	1 3 5 7 9			
Passe	1 3 5 7 9	,		

10. Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the  $p^{th}$  element of the list, sorted ascending. If there is no  $p^{th}$  element, return 0.

## Example

n = 20

p = 3

The factors of 20 in ascending order are  $\{1, 2, 4, 5, 10, 20\}$ . Using 1-based indexing, if p = 3, then 4 is returned. If p > 6, 0 would be returned.

#### **Constraints**

1 ≤ n ≤ 10<sup>15</sup>

1 ≤ p ≤ 10°

The first line contains an integer n, the number to factor.

The second line contains an integer p, the 1-based index of the factor to return.

## Sample Case 0

## Sample Input 0

10

3

## Sample Output 0

5

#### **Explanation 0**

Factoring n = 10 results in  $\{1, 2, 5, 10\}$ . Return the  $p = 3^{rd}$  factor, 5, as the answer.

#### Sample Case 1

# Sample Input 1

10

5

# Sample Output 1

0

## **Explanation 1**

Factoring n = 10 results in  $\{1, 2, 5, 10\}$ . There are only 4 factors and p = 5, therefore 0 is returned as the answer.

# Sample Case 2

# Sample Input 2

1

# Sample Output 2

1

# **Explanation 2**

Factoring n = 1 results in {1}. The p = 1st factor of 1 is returned as the answer.

# For example:

Input	Result
10 3	5
10 5	0
1	1

# Coding:

```
def fa(n,p):
    f=[i for i in range(1,n+1) if n%i ==0]
    f.sort()

if p <= len(f):
    return f[p-1]
    else:
    return 0

n = int(input())
p = int(input())
print(fa(n,p))</pre>
```

	Input	Expected	Got	
~	10 3	5	5	<b>~</b>
~	10 5	0	0	~
~	1	1	1	<b>~</b>
