# WEEK-08-MCQ-Tuple-Set

1. What is the output of the following code?

aTuple = (10, 20, 30, 40, 50, 60, 70, 80) print(aTuple[2:5], aTuple[:4], aTuple[3:])

a. (10, 20, 30, 40) (40, 50, 60, 70, 80)

b. (30, 40, 50)(40, 50, 60, 70, 80)

c. (30, 40, 50) (10, 20, 30, 40)

d. (30, 40, 50) (10, 20, 30, 40) (40, 50, 60, 70, 80)

- 2. Select which is true for Python tuple?
- a. We can change the tuple once created
- b. A tuple maintains the order of items
- c. A tuple is unordered
- d. None of these
- 3. Choose the correct option.
- a. In Python, a tuple can contain either string or integer but not both at a time.
- b. In Python, a tuple can contain both integers and strings as its elements.
- c. In Python, a tuple can contain only strings as its elements.
- d. In Python, a tuple can contain only integers as its elements.
- 4. What will be printed when the following code executes?

a = ("Python Programming")
print type(a)

a. <class 'tuple'>

b. <class 'str'>

c. str

d. <class 'int'>

5. What is the output of the given below program?

t1 = (1,2,3) t2 = (4,5,6) x = t1+t2print(x)

a.(1,2,3)(4,5,6)

b.Error

c.(1,2,3,3,2,1)

d.(1,2,3,4,5,6)

```
6. Write the Output of the following Code?
       t = (15,83,83,52,60,45,52,85,100)
        print(min(t)+max(t)+t.count(52))
a.100
                               b.2
                                                                              d.Error
                                                      c.117
7. Which of the following is a Python tuple?
a.{1,3,8,9,41}
                            b.(1,4,5,6,7)
                                                 c.[1,2,3,4]
                                                                       d.("Wonder")
8. Which of the following Python code will create a set?
(i) set1=set((0,9,0))
(ii) set1=set([0,2,9])
(iii) set1={}
a. iii
                       b. ii
                                           c. All of the above
                                                                      d. i,ii
9. What will be the output of following Python code?
     list1=[1,3,4,2]
     x=list1.pop(2)
     print(set([x]))
                                                                          d.{2}
a.{1,3,4}
                          b.{4}
                                                c.{1,3,2}
10. What will the below Python code do?
     set1={2,3}
     set2={3.2}
     set3={2,1}
     if(set1==set2):
          print("yes")
    else:
         print("no")
    if(set1==set3):
         print("yes")
    else:
         print("no")
a. No, No
                                                      b. Yes, No
c. "==" is not supported for set in Python
                                                      d. Yes. Yes
```

11. What will be the output of the below Python code? t1=(55,12,78,64,25) t1.pop(12) print(tuple1) a.(12) d.(55,78,64,25) b.Error c.12 12. What is the output of the following  $set1 = \{1, 2, 3, 4, 5\}$  $set2 = \{6, 7, 1, 3, 4, 8, 2, 5\}$ print(set1.issubset(set2)) print(set2.issuperset(set1)) a.FalseTrue b.TrueTrue c.FalseFalse d.TrueFalse 13. What will be the output of below Python code? tupl=("python","programming","Computer") print(tupl[-3:0]) a.Error b.() c.Computer d.(Computer) 14. What is the output of the given below program?  $my_t1 = (1, 2, 3, 4)$ my\_t1.append((5, 6, 7)) print(len(my\_t1)) b.2 d.5 a.Error c.1 15. Find the output of the given Python program? t1 = (1,2,3,(4,5))t2 = (3,2,1,(4,5))print(t1>t2) a.Error b.Error c.True d.False

# WEEK-08-CODING-Tuple-Set

1. There is a malfunctioning keyboard where some letter keys do not work. All other keys on the keyboard work properly.

Given a string text of words separated by a single space (no leading or trailing spaces) and a string brokenLetters of all distinct letter keys that are broken, return the number of words in text you can fully type using this keyboard.

Example 1:

Input: text = "hello world", brokenLetters = "ad"

Output:

1

Explanation: We cannot type "world" because the 'd' key is broken.

#### For example:

Input	Result
hello world ad	1
Faculty Upskilling in Python Programming ak	2

### Coding:

```
def main(t,l):
    b = set(l.lower())
    ws = t.split()
    c = 0
    for w in ws:
        if all(letter.lower() not in b for letter in w):
            c +=1
    return c

t = input().strip()
b = input().strip()
res = main(t,b)
print(res)
```

### **Output:**

Input Expected Got
✓ hello world ad 1 ✓
✓ Welcome to REC 1 1 ✓
✓ Faculty Upskilling in Python Programming 2 2 ✓

Passed all tests! 🗸

2. Coders here is a simple task for you, Given string str. Your task is to check whether it is a binary string or not by using python set.

Examples:

Input: str = "01010101010"

Output: Yes

Input: str = "REC101"

Output: No

### For example:

Input	Result
01010101010	Yes
010101 10101	No

## Coding:

```
s=input()
c=set(s)
if c <={'0', '1'}:
    print("Yes")
else:
    print("No")</pre>
```

	Input	Expected	Got	
~	01010101010	Yes	Yes	~
~	REC123	No	No	~
~	010101 10101	No	No	~

3. The **DNA sequence** is composed of a series of nucleotides abbreviated as 'A', 'C', 'G', and 'T'. For example, "ACGAATTCCG" is a **DNA sequence**.

When studying **DNA**, it is useful to identify repeated sequences within the DNA.

Given a string s that represents a **DNA sequence**, return all the **10-letter-long** sequences (substrings) that occur more than once in a DNA molecule. You may return the answer in **any order**.

#### Example 1:

Input: s = "AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT"
Output: ["AAAAAACCCCC","CCCCCAAAAA"]
Example 2:
Input: s = "AAAAAAAAAAAAA"
Output: ["AAAAAAAAAAAA"]

For example:

Input	Result
AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT	AAAAACCCCC CCCCAAAAA

### Coding:

```
def show(s):
    se = set()
    r = set()
    for i in range(len(s)-9):
        sq = s[i:i+10]
        if sq in se:
            r.add(sq)
        else:
            se.add(sq)
        return list(r)

n = input().strip()
res = show(n)
for resut in res:
        print(resut)
```

	Input	Expected	Got	
~	AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT		AAAAACCCCC CCCCCAAAAA	<b>~</b>
~	АААААААААА	АААААААА	АААААААА	~
Passe	d all tests! 🗸			

4. Given an array of integers nums containing n+1 integers where each integer is in the range [1, n] inclusive. There is only **one repeated number** in nums, return *this repeated number*. Solve the problem using set.

#### Example 1:

**Input:** nums = [1,3,4,2,2]

Output: 2 Example 2:

**Input:** nums = [3,1,3,4,2]

Output: 3 For example:

Input	Result
13442	4

### Coding:

```
def show(num):
    s=set()
    for n in num:
        if n in s:
            return n
        s.add(n)
    return -1

i = input()
num = list(map(int,i.split()))
res = show(num)
print(res)
```

	Input	Expected	Got	
~	1 3 4 4 2	4	4	~
~	1 2 2 3 4 5 6 7	2	2	~
Passe	d all tests! 🗸			

- 5. You are given an integer tuple nums containing distinct numbers. Your task is to perform a sequence of operations on this tuple until it becomes empty. The operations are defined as follows:
  - 1. If the first element of the tuple has the smallest value in the entire tuple, remove it.
  - 2. Otherwise, move the first element to the end of the tuple.

You need to return an integer denoting the number of operations required to make the tuple empty.

#### Constraints

- The input tuple nums contains distinct integers.
- The operations must be performed using tuples and sets to maintain immutability and efficiency.
- Your function should accept the tuple <u>nums</u> as input and return the total number of operations as an integer.

#### Example:

```
Input: nums = (3, 4, -1)
Output: 5
Explanation:
Operation 1: [3, 4, -1] \rightarrow First element is not the smallest, move to the end \rightarrow [4, -1, 3]
Operation 2: [4, -1, 3] \rightarrow First element is not the smallest, move to the end \rightarrow [-1, 3, 4]
Operation 3: [-1, 3, 4] \rightarrow First element is the smallest, remove it \rightarrow [3, 4]
Operation 4: [3, 4] \rightarrow First element is the smallest, remove it \rightarrow [4]
Operation 5: [4] \rightarrow First element is the smallest, remove it \rightarrow [4]
```

#### For example:

Test	Result
print(count_operations((3, 4, -1)))	5

### Coding:

```
def count_operations(nums: tuple) -> int:
    # Your implementation here
    from collections import deque

nums = deque(nums)
    c = 0
    while nums:
        m = min(nums)
        if nums[0] == m:
            nums.popleft()
        else:
            nums.append(nums.popleft())

        c +=1

return c
```

	Test	Expected	Got	
~	<pre>print(count_operations((3, 4, -1)))</pre>	5	5	~
~	<pre>print(count_operations((1, 2, 3, 4, 5)))</pre>	5	5	~
~	<pre>print(count_operations((5, 4, 3, 2, 1)))</pre>	15	15	~
~	<pre>print(count_operations((42, )))</pre>	1	1	~
~	<pre>print(count_operations((-2, 3, -5, 4, 1)))</pre>	11	11	~
Passe	d all tests! 🗸			

6. Write a program to eliminate the common elements in the given 2 arrays and print only the non-repeating

elements and the total number of such non-repeating elements.

Input Format:

The first line contains space-separated values, denoting the size of the two arrays in integer format respectively.

The next two lines contain the space-separated integer arrays to be compared.

#### Sample Input:

5 4

12865

26810

Sample Output:

1510

3

Sample Input:

55

12345

12345

Sample Output:

NO SUCH ELEMENTS

#### For example:

Input	Result
5 4 1 2 8 6 5 2 6 8 10	1 5 10 3
5 5 1 2 3 4 5 1 2 3 4 5	NO SUCH ELEMENTS

### Coding:

```
def main(ar1,ar2):
  s1 = set(ar1)
  s2 = set(ar2)
  c = s1.intersection(s2)
  u1 = s1 - c
  u2 = s2 - c
  u = u1.union(u2)
  return list(u)
z = input().strip().split()
z1,z2 = int(z[0]),int(z[1])
a1 = list(map(int,input().strip().split()))
a2 = list(map(int,input().strip().split()))
res = main(a1,a2)
if res:
  print(" "join(map(str,sorted(res))))
  print(len(res))
else:
  print("NO SUCH ELEMENTS")
```

	Input	Expected	Got	
~	5 4 1 2 8 6 5 2 6 8 10	1 5 10 3	1 5 10 3	~
~	3 3 10 10 10 10 11 12	11 12 2	11 12 2	~
~	5 5 1 2 3 4 5 1 2 3 4 5	NO SUCH ELEMENTS	NO SUCH ELEMENTS	~

7. Program to print all the distinct elements in an array. Distinct elements are nothing but the unique (non-duplicate) elements present in the given array.

#### Input Format:

First line take an Integer input from stdin which is array length n.

Second line take n Integers which is inputs of array.

#### Output Format:

Print the Distinct Elements in Array in single line which is space Separated

Example Input:

5

12234

Output:

1234

Example Input:

6

112233

Output:

123

#### For example:

Input	Result
5 1 2 2 3 4	1234

### Coding:

```
def show(arr):
    d = set(arr)
    print(" ".join(map(str,sorted(d))))
n = int(input())
arr =[int(input().strip()) for _ in range(n)]
show(arr)
```

8. Check if a set is a subset of another set.

```
Example:
Sample Input1:
mango apple
mango orange
mango
output1:
yes
set3 is subset of set1 and set2
input2:
```

mango orange banana orange

grapes output2: no

#### For example:

Test	Input	Result
1	mango apple mango orange mango	yes set3 is subset of set1 and set2
2	mango orange banana orange grapes	No

### Coding:

```
def main(s1,s2,ss):
  s1 = set(s1.split())
  s2 = set(s2.split())
  ss = set(ss.split())
  if ss.issubset(s1) and ss.issubset(s2):
    print("yes")
    print("set3 is subset of set1 and set2")
    print("No")
s1 = input().strip()
s2 = input().strip()
ss = input().strip()
res = main(s1,s2,ss)
```

### **Output:**

		Test	Input	Expected	Got	
	<b>&gt;</b>	1	mango apple mango orange mango	yes set3 is subset of set1 and set2	yes set3 is subset of set1 and set2	~
	<b>~</b>	2	mango orange banana orange grapes	No	No	~
ı	Passe	d all te	ests! 🗸			

9. Given a tuple and a positive integer k, the task is to find the count of distinct pairs in the tuple whose sum is equal to **K**. **Examples:** 

```
Input: t = (5, 6, 5, 7, 7, 8), K = 13 Output: 2 Explanation:
Pairs with sum K(= 13) are \{(5, 8), (6, 7), (6, 7)\}.
Therefore, distinct pairs with sum K(= 13) are \{(5, 8), (6, 7)\}. Therefore, the required output is 2.
```

#### For example:

Input	Result
1,2,1,2,5	1
1,2 O	0

### Coding:

```
def show(t,K):
    s=set()
    p=set()

for num in t:
    com = K- num
    if com in s:
        p.add((min(num, com), max(num, com)))
        s.add(num)
    return len(p)

tup = input()
t = tuple(map(int , tup.split(",")))
K = int(input())
res=show(t,K)
print(res)
```

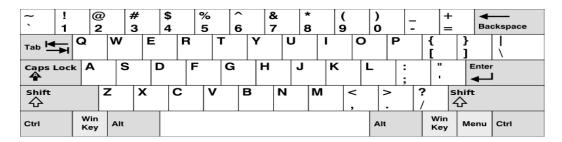

### **Output:**

	Input	Expected	Got	
~	5,6,5,7,7,8 13	2	2	~
~	1,2,1,2,5	1	1	~
~	1,2	0	0	~
Passe	d all tests! 🗸			

10. Given an array of strings words, return the words that can be typed using letters of the alphabet on only one row of American keyboard like the image below.

#### In the American keyboard:

- the first row consists of the characters "qwertyuiop",
- the second row consists of the characters "asdfghjkl", and
- the third row consists of the characters "zxcvbnm".

#### Example 1:

Input: words = ["Hello","Alaska","Dad","Peace"]

Output: ["Alaska","Dad"]

Example 2:

Input: words = ["omk"]

Output: [] Example 3:

Input: words = ["adsdf","sfd"]

Output: ["adsdf","sfd"]

For example:

Input	Result
4 Hello Alaska Dad Peace	Alaska Dad

Input	Result
2 adsfd afd	adsfd afd

```
Coding: def word(w):
  r1=set("qwertyuiop")
  r2=set("asdfghjkl")
r3=set("zxcvbnm")
  res=[]
  for wo in w:
     I = set(wo.lower())
     if 1 <= r1 or 1 <= r2 or 1 <= r3:
        res.append(wo)
  return res
i = int(input())
w=[]
for _ in range(i):
  wo = input()
  w.append(wo)
res =word(w)
if res:
  for wo in res:
     print(wo)
else:
  print("No words")
```

	Input	Expected	Got	
~	4 Hello Alaska Dad Peace	Alaska Dad	Alaska Dad	~
~	1 omk	No words	No words	~
~	2 adsfd afd	adsfd afd	adsfd afd	~
